

QS LIFELINE 15 m

This throwing line which is 15 m long with a built-in inflatable buoy that is suitable for everyone staying in or near water, in the boat, on the snowmobile, ice skaters, fishermen and others. The throwing line is a lighter variant of the Lifebuoy with a line and can be used in both winter and summer. This inflatable lifebuoy has an automatic function that is inflated by direct contact with water in 3 seconds. It will make the drowning victim feel secure and safe to have something to float on and be able to stay up in the water. It also makes it easy to pull in person for a quick rescue operation. The advantage of QS Lifeline is that it's very easy to throw out 15 meter away. Keep the yellow loop in one hand and throw out the bag with the other hand for best effect and accuracy. Throwing lines shall not be used for personal protection. By also re-loading kit

QS RESCUELINE

QS Lifeline is an inflatable throwing line that has an inflation valve connected to an inflatable bladder. This valve has an automatic function, but can if necessary even be triggered manually. The throwing line shall be thrown into the water to the victim, who can now feel secure by having something to float on and can easily be drawn into the safety to the boat or land.

The automatic function inflates the lifebuoy in about 3 seconds when the bag struck the water. After using the throwing line, the air will be empty through the red mouth valve and the line can now be re-used. The propellant in our cartridges is harmless carbon dioxide of food quality.

NOTE! After the line has been inflated it must be recharged. See the instruction manual which recharges kit that will be used.

QS LIFELINE includes: outer bag inflator mechanism mouth valve, fluorescent orange / yellow airtight bladder, drawstring, 15 m throwing line.

DRAIN

On the red mouth valve is a black cork, lifting the cap and invert so that the top is pressed against the green hole in the red tube. Hold and press until all air are empty out and the orange / yellow air lung is fully deflated.

FOR USE Every time you use your inflatable heaving line should be checked:

Check the cartridge, unscrew the cartridge (counter clockwise) and check that it is not pierced. Screw the non-perforated cartridge (clockwise) by hand. Perforated gas cartridge is depleted and must be replaced.

Check the safety pin and cartridge. Make sure the green safety pin is in place. Missing this and the CO₂-cartridge is pierced the lifejacket must be recharged. Also check that the CO₂-cartridge is not too old.

Check the drawstring to be secured and not hanging loose but still easily accessible and easy to reach.

Recharging: QS Lifeline automatic / cartridge

If the line is activated automatically replace the CO₂ cartridge. Screw the CO₂ cartridge and cartridge. Check that it is a new green safety pin over the manual; attach a new one if it is missing. Install a new cartridge, and to date has not been passed, a non-perforated CO₂ cartridge and a green safety pin. Use only hand pressure when assembling the parts.

RE-UNPACKING AND RECYCLING

After checking the recharging putty is complete, fold the air lung with the automatic drive outward (orange side) so that the tripping mechanism is visible. The whole lung is placed into the bag before the 15 m rope is packed into the bag. Make sure the cord cannot get caught in any internal objects so that it does not stick when it is thrown out to the victim.

OBS! QS Lifeline shall be kept dry; with direct contact with water can it be activated involuntary!!

Technic data:

Tub: Nylon

Tub thickness: 380 µ

60 N floating capacity fully activated

Cartridge: 16 g CO₂, threaded

Inflate technic: Automatic Gas

Weight: 0,5 kg
